FMA on the Litvak planted-error benchmark

100 planted errors over 10 paper(s). Reference run for $+X/-Y$: **FMA claude-opus-5**. Union of Litvak's systems: **89** of 100 – the empirical ceiling. *total flags* is every issue reported across the ten papers, matched or not: the column that separates a precise system from a verbose one. No system here, ours included, has a published precision figure.

1. Leaderboard

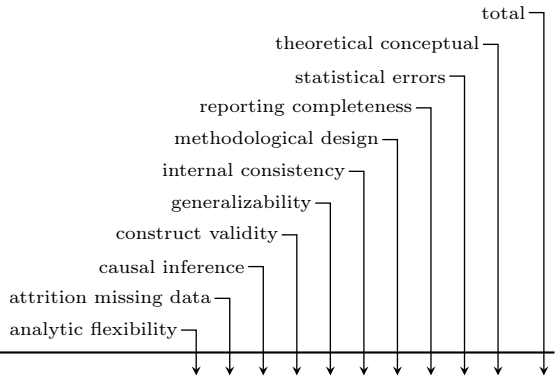

system	caught	total flags	$+X$	$-Y$
GPT-5.5 (high reasoning)	63	512	28	5
GPT-5.5 (no reasoning)	62	704	27	5
GPT-5.4 (high reasoning)	55	278	21	6
Claude Opus 4.6 (no thinking)	54	310	23	9
GPT-5.4 (no reasoning)	54	421	21	7
Claude Opus 4.6 (high thinking)	52	293	20	8
Claude Opus 4.8 (high thinking)	49	227	14	5
Claude Sonnet 4.6 (no thinking)	49	356	20	11
Refine.ink	47	305	14	7
Claude Sonnet 4.6 (high thinking)	45	241	14	9
Claude Opus 4.8 (no thinking)	43	279	11	8
FMA (Claude Opus 5)	40	206	0	0
Gemini 3.1 Pro	39	203	14	15
Gemini 3 Flash	25	200	3	18
Reviewer3	24	125	4	20

2. Adjusted (Litvak's correction: modified minus originals)

Nothing is planted in the unmodified papers, so every match there is the judge matching something to nothing. Across his 14 systems, $r(\text{findings}, \text{false positives}) = 0.726$: the raw leaderboard rewards volume. *not computed* = no clean-control run exists for that row.

system	raw	FP clean	adjusted	shift
GPT-5.5 (high reasoning)	63	24	39	+0
Claude Opus 4.8 (high thinking)	49	16	33	+5
GPT-5.4 (no reasoning)	54	23	31	+2
GPT-5.5 (no reasoning)	62	34	28	-2
Claude Opus 4.6 (no thinking)	54	26	28	-1
Refine.ink	47	19	28	+3
Claude Opus 4.6 (high thinking)	52	26	26	-1
Claude Sonnet 4.6 (high thinking)	45	22	23	+2
Claude Opus 4.8 (no thinking)	43	20	23	+2

Reviewer3	3	3	3	3	2	3	3	1	3	0	24

Caveats

1. Litvak's figures are recomputed from his stored per-error results on the papers scored here, not quoted from his published leaderboard.
2. Different input: his systems read the flattened text PDF from 'docx_to_pdf.py'; ours read whatever the scored corpus was built from. A layout-preserving conversion favours us on table-bound checks.
3. Leaderboard and category figures use LITVAK'S PROTOCOL on every row: his haiku judge, one call per finding, no evidence requirement. That is how his systems were scored, so it is the only like-for-like comparison.

4. The ‘verified‘ column is a separate, stricter measurement of our runs only – one judgement per error, shown every finding for that paper, required to quote verbatim the words identifying the defect, with the quote checked in code. It is the better estimate of what we caught and is NOT comparable to the other rows.

5. ‘+X‘ = errors that system caught and the reference run missed. ‘-Y‘ = errors the reference run caught and it missed.

6. Litvak’s RAW scores are inflated in proportion to how much a system writes: r(findings, false positives on clean papers) = 0.726 over his 14 systems. His adjusted table is the defensible ranking, and we cannot yet appear on it – we have no clean-control run.
